Document: #HT000099

**Document Title: Adjust Bag Tear-Off Settings**

Product(s): T-375

Procedure:

Bag Tear-Off can be affected by three different settings:

- Continuous Strip Option
- Reverse Speed Setting
- Reverse Distance Setting

Continuous Strip Counter

The **Continuous Strip Option** allows bags to be sealed without being separated. Therefore, if this option is turned on, the bags will not automatically separate. To turn this option off, access the **Continuous Strip Counter Menu**, and turn "**Continuous Strip**" 'OFF'.

Reverse Speed

The **Reverse Speed Control** is accessed through the "**Bagger Factory Settings**" menu. This controls the speed, in inches per second, at which the bagger reverses to separate the bag at the perforation.

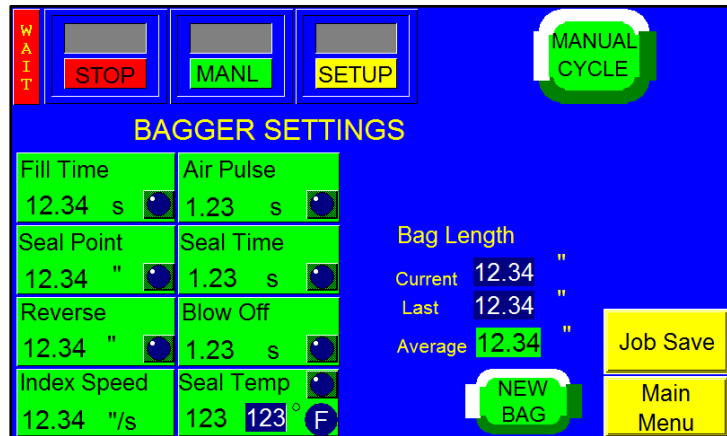

To change this setting, press the **"Revrs Speed"** button, enter a value on the numeric keypad and press the **<ENT>** button.

The nominal speed is 1 to 2 inches per second.

Reverse Distance

This is the **Distance** (in inches) that the bag reverses to cause the perforation to break between the bags.

This is accessed through the **"Bagger Settings"** menu; the control is labeled **"Reverse"**.

For wider bags, the distance may need to be increased. A typical setting is between 0.5" and 1".
